Yeh - Patt

A: T N T N T N T N ...

B: N T T T T T T T

$$CPI = 1 + \text{stalls}$$

predictor is 90% accurate

1:5 is a branch 20%

penalty for misprediction = 3 cycles

$$\begin{aligned} CPI &= 1 + 0.2 \times (1 - 0.9) \times 3 \\ &= 1.06 \end{aligned}$$

$$\text{CPU time} = IC \times CPI \times CT$$

Branch prediction accuracy
determines pipeline depth
